

ADM Demonstration EBU PTS 2026

ADM-IG Report

Overview

- BBC Initiative
- Multi-vendor participation
- File-based workflow
- Live workflow
- Web workflow
- End-to-end workflow

ADM Studio @ EBU PTS 2026

Preparation Challenges

- Conformance issues fixed
- Content limited to 16 audio channels for transport
- Profile differences between Dolby/MPEG-H
- Plain/Gzip S-ADM issues fixed (buffer overflow)
- Serialization issues fixed (corner cases, distinguished values)
- ADM/S-ADM features interpretation (expected fixed identifiers)
- Obscure error/warning messages across devices
- Special setup for single S-ADM stream vs dual S-ADM stream

On-site Challenges

- ADM adjustments on some demo files (audio rendering)
- ADM simplification on some demo files (encoder limitations)
- ADM Metadata readout limited in systems used
- (other) Metadata passthrough for HDR video not well supported

Conclusions #1

- All the demos worked in the end
- Demos were performed on-site (end-to-end)
- Attendance included people with/without knowledge of the topic. More education is needed
- No direct user/operator was attending the event
- **The demo was also the first ever ADM/S-ADM plugfest**
- Various causes of friction were identified (some fixed)
- Several ***bonus*** use cases were partially tested

Conclusions #2

- **More end-to-end demos must be organized**
- Need to work on the details
- Need for information on encoder limitations
- NGA encoder vendors should have their own profiles (on the top/below of AdvSS Emission Profile)
- **Interoperability points must be defined**
(-> Interoperability Matrix)

Comments/Questions

Daniele: Do we need sub-profiles for AdvSS EMI? It's frightening...

Dan: The DolbyE profile seems to be such a thing)

Dave: Vendors should know how to get from EMI to their encoders....

Roman: One vendor was present and became aware of the issues and the shortcomings in documentation
